Revision History

The following table shows the revision history for this document.

Date	Version	Revision
01/23/12	1.0	Initial Xilinx release.
04/05/12	1.1	Updated links from Table 1-1, page 10 . Revised the JTAG configuration mode USB cable description under FPGA Configuration, page 11 . Added Encryption Key Backup Circuit, page 12 and Table 1-4, page 13 . Added links to User SMA Clock Input in Table 1-8, page 25 . Added link to Si570 device vendor on page 27 . Added Ethernet PHY Status LEDs, page 49 and Figure 1-24, page 49 . Updated Power On/Off Slide Switch SW15, page 54 and added Figure 1-32, page 55 . Revised FPGA Mezzanine Card Interface, page 56 and Table 1-28, page 57 and Table 1-29, page 62 . Added description of power module cooling requirement to Power Management, page 63 . Added Cooling Fan Control, page 66 . Updated Table 1-35, page 71 . Added references to Documents, page 85 . Added Appendix E, Compliance with European Union Directives and Standards , Appendix D, Board Setup , and Appendix E, Board Specifications .
12/10/12	1.2	Replaced direct, inline links to external references in the body text with indirect references to the links in a numbered list in Appendix F, Additional Resources . Revised the value for frequency jitter for the System Clock Source, page 26 . Revised jumper information for SFP_RS1, page 38 in Table 1-15 . Revised contents and organization of Appendix F, Additional Resources .

Date	Version	Revision
05/10/2013	1.3	<p>Updated Figure 1-1 to show v 1.1 board. Updated Table 1-1, page 10: callout 1 to identify Fansink, callouts 25 and 26 pointing to User I/O. Added Table 1-9, page 26 Source to FPGA Connections. Updated Programmable User Clock Source, page 27 to include I²C address. Updated Table 1-17, page 37 for naming pins 18 and 19. Added Note to Table 1-14, page 37. Updated I2C Bus Switch, page 47 to show TI device instead of NXP Semiconductor, deleted; updated [Ref 9]. Added Figure 1-28, page 52 Rotary Switch, and Figure 1-29, page 52 GPIO SMAs J13 and J14. Added Note to Appendix C, Master Board Constraints. Updated Appendix D, Board Setup, step 1 of installation procedure. Updated Appendix G, Regulatory and Compliance Information to include CE PC Test reference.</p>
07/18/2013	1.4	<p>Revised the format of Table 1-20 and added the IO standard column. Revised the FPGA U1 pin for FMC_HPC_CLK0_M2C_N in Table 1-28 to C27 on page 60. Revised the descriptions of the functions for SW13 position 3 and position 5 in Table A-2. In Appendix C, Master Board Constraints, changed appendix title from Master UCF Listing to Master Board Constraints, replaced references to the term UCF with the term XDC and replaced the KC705 Board UCF Listing with the KC705 Board XDC Listing.</p>

KC705 Evaluation Board Features

Overview

The KC705 evaluation board for the Kintex™-7 FPGA provides a hardware environment for developing and evaluating designs targeting the Kintex-7 XC7K325T-2FFG900C FPGA. The KC705 board provides features common to many embedded processing systems, including a DDR3 SODIMM memory, an 8-lane PCI Express® interface, a tri-mode Ethernet PHY, general purpose I/O, and a UART interface. Other features can be added by using mezzanine cards attached to either of two VITA-57 FPGA mezzanine connectors (FMC) provided on the board. High pin count (HPC) and low pin count (LPC) FMCs are provided. See [KC705 Board Features](#) for a complete list of features. The details for each feature are described in [Feature Descriptions, page 9](#).

Additional Information

See [Appendix F, Additional Resources](#) for references to documents, files and resources relevant to the KC705 board.

KC705 Board Features

- Kintex-7 XC7K325T-2FFG900C FPGA
- 1 GB DDR3 memory SODIMM
- 128 MB Linear BPI Flash memory
- 128 Mb Quad-SPI Flash memory
- Secure Digital (SD) connector
- USB JTAG via Digilent module
- Clock Generation
 - Fixed 200 MHz LVDS oscillator (differential)
 - I²C programmable LVDS oscillator (differential)
 - SMA connectors (differential)
 - SMA connectors for GTX transceiver clocking
- GTX transceivers
 - FMC HPC connector (four GTX transceivers)
 - FMC LPC connector (one GTX transceiver)
 - SMA connectors (one pair each for TX, RX and REFCLK)
 - PCI Express (eight lanes)
 - Small form-factor pluggable plus (SFP+) connector

- Ethernet PHY SGMII interface (RJ-45 connector)
- PCI Express endpoint connectivity
 - Gen1 8-lane (x8)
 - Gen2 8-lane (x8)
- SFP+ Connector
- 10/100/1000 tri-speed Ethernet PHY
- USB-to-UART bridge
- HDMI codec
- I²C bus
 - I²C MUX
 - I²C EEPROM (1 KB)
 - USER I²C programmable LVDS oscillator
 - DDR3 SODIMM socket
 - HDMI codec
 - FMC HPC connector
 - FMC LPC connector
 - SFP+ connector
 - I²C programmable jitter-attenuating precision clock multiplier
- Status LEDs
 - Ethernet status
 - Power good
 - FPGA INIT
 - FPGA DONE
- User I/O
 - USER LEDs (eight GPIO)
 - User pushbuttons (five directional)
 - CPU reset pushbutton
 - User DIP switch (4-pole GPIO)
 - User edge drive rotary encoder switch
 - User SMA GPIO connectors (one pair)
 - LCD character display (16 characters x 2 lines)
- Switches
 - Power on/off slide switch
 - FPGA_PROG_B pushbutton switch
- VITA 57.1 FMC HPC Connector
- VITA 57.1 FMC LPC Connector
- Power management
 - PMBus voltage and current monitoring via TI power controller
- XADC header
- Configuration options

- Linear BPI Flash memory
- Quad SPI
- USB JTAG configuration port
- Platform cable header JTAG configuration port

The KC705 board block diagram is shown in [Figure 1-1](#). The KC705 board schematics are available for download from The KC705 Evaluation Kit Product Page:

www.xilinx.com/kc705

Caution! The KC705 board can be damaged by electrostatic discharge (ESD). Follow standard ESD prevention measures when handling the board

Figure 1-1: KC705 Board Block Diagram

Feature Descriptions

[Figure 1-2](#) shows the KC705 board. Each numbered feature that is referenced in [Figure 1-2](#) is described in the sections that follow.

Note: The image in [Figure 1-2](#) is for reference only and might not reflect the current revision of the board.

Kintex-7 FPGA

[Figure 1-2, callout 1]

The KC705 board is populated with the Kintex-7 XC7K325T-2FFG900C FPGA.

For further information on Kintex-7 FPGAs, see [DS180, 7 Series FPGAs Overview](#).

FPGA Configuration

The KC705 board supports three of the five 7 Series FPGA configuration modes:

- Master SPI using the onboard Quad SPI Flash memory
- Master BPI using the on-board Linear BPI Flash memory
- JTAG using a standard-A to micro-B USB cable for connecting the host PC to the KC705 board configuration port

Each configuration interface corresponds to one or more configuration modes and bus widths as listed in [Table 1-2](#). The mode switches M2, M1, and M0 are on SW13 positions 3, 4, and 5 respectively as shown in [Figure 1-3](#).

Figure 1-3: SW13 Default Settings

The default mode setting is $M[2:0] = 010$, which selects Master BPI at board power-on. Refer to the [Configuration Options, page 71](#) for detailed information about the mode switch SW13.

Table 1-2: KC705 board FPGA Configuration Modes

Configuration Mode	SW13 DIP switch Settings (M[2:0])	Bus Width	CCLK Direction
Master SPI	001	x1, x2, x4	Output
Master BPI	010	x8, x16	Output
JTAG	101	x1	Not Applicable

For full details on configuring the FPGA, see [UG470, 7 Series FPGAs Configuration User Guide](#)

Encryption Key Backup Circuit

FPGA U1 implements bitstream encryption key technology. The KC705 board provides the encryption key backup battery circuit shown in [Figure 1-4](#). The rechargeable 1.5V lithium button-type battery B1 is soldered to the board with the positive output connected to FPGA U1 VCCBATT pin C10. The battery supply current I_{BATT} specification is 150 nA max when board power is off. B1 is charged from the VCCAUX_IO 2.0V rail through a series diode with a typical forward voltage drop of 0.38V. and 4.7 KΩ current limit resistor. The nominal charging voltage is 1.62V.

Figure 1-4: Encryption Key Backup Circuit

I/O Voltage Rails

There are 10 I/O banks available on the Kintex-7 device. The voltages applied to the FPGA I/O banks used by the KC705 board are listed in [Table 1-3](#).

Table 1-3: I/O Voltage Rails

U1 FPGA Bank	Power Supply Rail Net Name	Voltage
Bank 0	VCC2V5_FPGA	2.5V
Bank 12 ⁽¹⁾	VADJ_FPGA	2.5V (default)
Bank 13 ⁽¹⁾	VADJ_FPGA	2.5V (default)
Bank 14	VCC2V5_FPGA	2.5V
Bank 15	VCC2V5_FPGA	2.5V
Bank 16 ⁽¹⁾	VADJ_FPGA	2.5V (default)
Bank 17 ⁽¹⁾	VADJ_FPGA	2.5V (default)
Bank 18 ⁽¹⁾	VADJ_FPGA	2.5V (default)
Bank 32	VCC1V5_FPGA	1.5V
Bank 33	VCC1V5_FPGA	1.5V
Bank 34	VCC1V5_FPGA	1.5V

Notes:

1. The VADJ_FPGA rail can support 1.8V, 2.5V, or 3.3V. For more information on VADJ_FPGA see [Power Management, page 63](#).

DDR3 Memory Module

[Figure 1-2, callout 2]

The memory module at J1 is a 1 GB DDR3 small outline dual-inline memory module (SODIMM). It provides volatile synchronous dynamic random access memory (SDRAM) for storing user code and data.

- Part number: MT8JTF12864HZ-1G6G1 (Micron Technology)
- Supply voltage: 1.5V
- Datapath width: 64 bits
- Data rate: Up to 1,600 MT/s

The DDR3 interface is implemented across I/O banks 32, 33, and 34. Each bank is a 1.5V high-performance (HP) bank having a dedicated DCI VRP/N resistor connection. An external 0.75V reference VTTREF is provided for data interface banks 32 and 34. Any interface connected to these banks that requires a reference voltage must use this FPGA voltage reference. The connections between the DDR 3 memory and the FPGA are listed in [Table 1-4](#).

Table 1-4: DDR3 Memory Connections to the FPGA

The KC705 DDR3 SODIMM interface adheres to the constraints guidelines documented in the DDR3 Design Guidelines section of [UG586, 7 Series FPGAs Memory Interface Solutions User Guide](#). The KC705 DDR3 SODIMM interface is a 40Ω impedance implementation. Other memory interface details are available in [UG586](#) and [UG473, 7 Series FPGAs Memory Resources User Guide](#). For more information about the Micron MT8JTF12864HZ-1G6G1 see [Ref 5].

Linear BPI Flash Memory

[Figure 1-2, callout 3]

The Linear BPI Flash memory located at U58 provides 128 MB of nonvolatile storage that can be used for configuration or software storage. The data, address, and control signals are connected to the FPGA. The BPI Flash memory device is packaged in a 64-pin BGA.

- Part number: PC28F00AP30TF (Numonyx)
- Supply voltage: 2.5V
- Datapath width: 16 bits (26 address lines and 7 control signals)
- Data rate: Up to 33 MHz

The Linear BPI Flash memory can synchronously configure the FPGA in Master BPI mode at the 33 MHz data rate supported by the PC28F00AP30TF Flash memory by using a configuration bitstream generated with bitgen options for synchronous configuration and for configuration clock division. The fastest configuration method uses the external 66 MHz oscillator connected to the FPGA EMCCCLK pin with a bitstream that has been built to divide the configuration clock by two. The division is necessary to remain within the synchronous read timing specifications of the Flash memory.

Multiple bitstreams can be stored in the Linear BPI Flash. The two most significant address bits (A25, A24) of the Flash memory are connected to DIP switch SW13 positions 1 and 2 respectively, and to the RS1 and RS0 pins of the FPGA. By placing valid XC7K325T bitstreams at four different offset addresses in the Flash memory, 1 of the 4 bitstreams can be selected to configure the FPGA by appropriately setting the DIP switch SW13. The connections between the BPI Flash memory and the FPGA are listed in [Table 1-5](#).

Table 1-5: BPI Flash Memory Connections to the FPGA

Additional FPGA bitstreams can be stored and used for configuration by setting the Warm Boot Start Address (WBSTAR) register contained in 7 series FPGAs. More information is available in the reconfiguration and multiboot section in [UG470, 7 Series FPGAs Configuration User Guide](#). The configuration section in this document provides details on the Master BPI configuration mode.

[Figure 1-5](#) shows the connections of the linear BPI Flash memory on the KC705 board.

For more information about the Numonyx PC28F00AP30TF see [\[Ref 5\]](#).

UG810_c1_04_011212

Figure 1-5: 128 MB Linear Flash Memory (U58)

Quad-SPI Flash Memory

[Figure 1-2, callout 4]

The Quad-SPI Flash memory located at U7 on the back side of the board provides 128 Mb of nonvolatile storage that can be used for configuration and data storage.

- Part number: N25Q128A13BSF40F (Numonyx)
- Supply voltage: 2.8V
- Datapath width: 4 bits
- Data rate: Various depending on Single/Dual/Quad mode and CCLK rate

Four data lines and the FPGA CCLK pin are wired to the Quad-SPI Flash memory. A common chip select (FPGA_FCS) shared between the Linear BPI Flash and the Quad-SPI Flash is controlled by the configuration mode settings on DIP switch SW13 position 5 (M0) and a one-of-two demultiplexer device U64. If mode pin M0 = 1, the SPI device is selected. If mode pin M0 = 0, the Linear BPI Flash device is selected. The connections between the SPI Flash memory and the FPGA are listed in [Table 1-6](#).

Table 1-6: Quad-SPI Flash Memory Connections to the FPGA

U1 FPGA Pin	Net Name	U7 Quad-SPI Flash Memory	
		Pin Number	Pin Name
P24	FLASH_D0	15	DQ0
R25	FLASH_D1	8	DQ1
R20	FLASH_D2	9	DQ2
R21	FLASH_D3	1	DQ3
B10	FPGA_CCLK	16	C
U19	QSPI_IC_CS_B ⁽¹⁾	7	S_B

Notes:

1. FPGA_FCS connected to FPGA U1 pin U19 becomes QSPI_IC_CS_B through U64 and J3.

The configuration section of [UG470, 7 Series FPGAs Configuration User Guide](#) provides details on using the Quad-SPI Flash memory. [Figure 1-6](#) shows the connections of the Quad-SPI Flash memory on the KC705 board.

For more information about the Numonyx N25Q128A13BSF40F see [\[Ref 5\]](#).

Figure 1-6: 128 Mb Quad-SPI Flash memory

SD Card Interface

[[Figure 1-2, callout 5](#)]

The KC705 board includes a secure digital input/output (SDIO) interface to provide user-logic access to general purpose non-volatile SDIO memory cards and peripherals. The SD card slot is designed to support 50 MHz high speed SD cards.

The SDIO signals are connected to I/O bank 12 which has its VCCO set to VADJ. A Texas Instruments I TXB0108 8-bit bidirectional voltage-level translator is used between the FPGA and the SD card connector (U9). Figure 1-7 shows the connections of the SD card interface on the KC705 board.

Figure 1-7: SD card interface

Table 1-7 lists the SD card interface connections to the FPGA.

Table 1-7: SDIO Connections to the FPGA

U1 FPGA Pin Name	Schematic Net Name	U57 Level Shifter		U9 SDIO Connector	
		Pin Name (A)	Pin Name (B)	Pin Number	Pin Name

USB JTAG Module

[Figure 1-2, callout 6]

JTAG configuration is provided through a Digilent onboard USB-to-JTAG configuration logic module (U59) where a host computer accesses the KC705 board JTAG chain through a standard-A plug (host side) to micro-B plug (KC705 board side) USB cable.

A 2-mm JTAG header (J60) is also provided in parallel for access by Xilinx download cables such as the Platform Cable USB II and the Parallel Cable IV.

The JTAG chain of the KC705 board is illustrated in Figure 1-8. JTAG configuration is allowed at any time regardless of FPGA mode pin settings. JTAG initiated configuration takes priority over the configuration method selected through the FPGA mode pin settings at SW13.

Figure 1-8: JTAG Chain Block Diagram

When an FMC mezzanine card is attached to the KC705 board it is automatically added to the JTAG chain through electronically controlled single-pole single-throw (SPST) switches U76 and U77. The SPST switches are in a normally closed state and transition to an open state when an FMC mezzanine card is attached. Switch U76 adds an attached FMC HPC mezzanine card to the FPGAs JTAG chain as determined by the FMC_HPC_PRSNT_M2C_B signal. Switch U77 adds an attached FMC LPC mezzanine card to the FPGAs JTAG chain as determined by the FMC_LPC_PRSNT_M2C_B signal. The attached FMC card must implement a TDI-to-TDO connection via a device or bypass jumper for the JTAG chain to be completed to the FPGA U1.

The JTAG connectivity on the KC705 board allows a host computer to download bitstreams to the FPGA using the Xilinx iMPACT software. In addition, the JTAG connector allows debug tools such as the ChipScope™ Pro Analyzer or a software debugger to access the FPGA. The iMPACT software tool can also indirectly program the Linear BPI Flash or the Quad-SPI Flash memory. To accomplish this, the iMPACT software configures the FPGA with a temporary design to access and program the BPI or Quad-SPI Flash memory device. The JTAG circuit is shown in Figure 1-9.

Figure 1-9: JTAG Circuit

Clock Generation

There are five clock sources available for the FPGA fabric on the KC705 board (refer to [Table 1-8](#)).

Table 1-8: KC705 Board Clock Sources

Clock Name	Reference	Description
System Clock	U6	SiT9102 2.5V LVDS 200 MHz Fixed Frequency Oscillator (Si Time). See System Clock Source, page 26 .
User Clock	U45	Si570 3.3V LVDS I ² C Programmable Oscillator (Silicon Labs). Default power-on frequency 156.250 MHz. See Programmable User Clock Source, page 27 .

Table 1-8: KC705 Board Clock Sources (Cont'd)

Clock Name	Reference	Description
User SMA Clock (differential pair)	J11	USER_SMA_CLOCK_P (net name). See User SMA Clock Input, page 29 .
	J12	USER_SMA_CLOCK_N (net name) See User SMA Clock Input, page 29
GTX SMA REF Clock (differential pair)	J16	SMA_MGT_REFCLK_P (net name). See GTX SMA Clock Input, page 29 .
	J15	SMA_MGT_REFCLK_N (net name). See GTX SMA Clock Input, page 29 .
Jitter Attenuated Clock	U70	Si5324C LVDS precision clock multiplier/jitter attenuator (Silicon Labs). See Jitter Attenuated Clock, page 30 .

Table 1-9 lists the pin-to-pin connections from each clock source to the FPGA.

Table 1-9: Source to FPGA Clock Connections

Clock Source Pin	Net Name	FPGA (U1) Pin
U6.5	SYSCLK_N	AD11
U6.4	SYSCLK_P	AD12
U45.5	USER_CLOCK_N	K29
U45.4	USER_CLOCK_P	K28
J12.1	USER_SMA_CLOCK_N	K25
J11.1	USER_SMA_CLOCK_P	L25
J15.1	SMA_MGT_REFCLK_N	J7
J16.1	SMA_MGT_REFCLK_P	J8
U70.29	Si5326_OUT_N	L7
U70.28	Si5326_OUT_P	L8

System Clock Source

[Figure 1-2, callout 7]

The KC705 board has a 2.5V LVDS differential 200 MHz oscillator (U6) soldered onto the back side of the board and wired to an FPGA MRCC clock input on bank 33. This 200 MHz signal pair is named SYSCLK_P and SYSCLK_N, which are connected to FPGA U1 pins AD12 and AD11 respectively.

- Oscillator: Si Time SiT9102AI-243N25E200.00000 (200 MHz)
- PPM frequency jitter: 50 ppm
- Differential Output

The system clock circuit is shown in [Figure 1-10](#).

Figure 1-10: System Clock Source

For more about the Si Time SiT9102 see [Ref 7].

Programmable User Clock Source

[Figure 1-2, callout 8]

The KC705 board has a programmable low-jitter 3.3V differential oscillator (U45) the FPGA MRCC inputs of bank 15. This USER_CLOCK_P and USER_CLOCK_N clock signal pair are connected to FPGA U1 pins K28 and K29 respectively. On power-up the user clock defaults to an output frequency of 156.250 MHz. User applications can change the output frequency within the range of 10 MHz to 810 MHz through an I²C interface. Power cycling the KC705 board will revert the user clock to its default frequency of 156.250 MHz.

- Programmable Oscillator: Silicon Labs Si570BAB0000544DG (10 MHz - 810 MHz)
- Differential Output
- I²C address 0x5D

The user clock circuit is shown in Figure 1-11.

Figure 1-11: User Clock Source

For more information about the Silicon Labs Si570 see [Ref 8].

Reference design files are available to demonstrate how to program the Si570 programmable oscillator. See:

- [XTP186, KC705 Si570 Programming](#)
- [RDF0175, Reference Design Files](#)
- [XTP187, KC705 Si570 Fixed Frequencies](#)
- [RDF0176, Reference Design Files](#)

User SMA Clock Input

[Figure 1-2, callout 9]

An external high-precision clock signal can be provided to the FPGA bank 15 by connecting differential clock signals through the onboard 50Ω SMA connectors J11 (P) and J12 (N). The differential clock has signal names are USER_SMA_CLOCK_P and USER_SMA_CLOCK_N, which are connected to FPGA U1 pins L25 and K25 respectively. The user-provided 2.5 V differential clock circuit is shown in Figure 1-12.

Figure 1-12: User SMA Clock Source

GTX SMA Clock Input

[Figure 1-2, callout 10]

The KC705 board includes a pair of SMA connectors for a GTX clock wired to GTX Quad bank 117. This differential clock has signal names SMA_MGT_REFCLK_P and SMA_MGT_REFCLK_N, which are connected to FPGA U1 pins J8 and J7 respectively. Figure 1-13 shows this AC-coupled clock circuit.

- External user-provided GTX reference clock on SMA input connectors
- Differential Input

Figure 1-13: GTX SMA Clock Source

Jitter Attenuated Clock

[Figure 1-2, callout 11]

The KC705 board includes a Silicon Labs Si5324 jitter attenuator U70 on the back side of the board. FPGA user logic can implement a clock recovery circuit and then output this clock to a differential I/O pair on I/O bank 13 (REC_CLOCK_C_P, FPGA U1 pin W27 and REC_CLOCK_C_N, FPGA U1 pin W28) for jitter attenuation. The jitter attenuated clock (SI5326_OUT_C_P, SI5326_OUT_C_N) is then routed as a reference clock to GTX Quad 116 inputs MGTREFCLK0P (FPGA U1 pin L8) and MGTREFCLK0N (FPGA U1 pin L7).

The primary purpose of this clock is to support CPRI/OBSAI applications that perform clock recovery from a user-supplied SFP/SFP+ module and use the jitter attenuated recovered clock to drive the reference clock inputs of a GTX transceiver. The jitter attenuated clock circuit is shown in [Figure 1-14](#).

Figure 1-14: Jitter Attenuated Clock

For more information about the Silicon Labs Si5324 see [\[Ref 8\]](#).

GTX Transceivers

[Figure 1-2, callout 12]

The KC705 board provides access to 16 GTX transceivers:

- Eight of the GTX transceivers are wired to the PCI Express® x8 endpoint edge connector (P1) fingers
- Four of the GTX transceivers are wired to the FMC HPC connector (J22)
- One GTX is wired to the FMC LPC connector (J2)
- One GTX is wired to SMA connectors (RX: J17, J18 TX: J19, J20)
- One GTX is wired to the SFP/SFP+ Module connector (P5)
- One GTX is used for the SGMII connection to the Ethernet PHY (U37)

The GTX transceivers in 7 Series FPGAs are grouped into four channels described as Quads. The reference clock for a Quad can be sourced from the Quad above or Quad below the GTX Quad of interest. There are four GTX Quads on the KC705 board with connectivity as shown here:

- Quad 115:
 - No directly wired GTX input reference clocks
 - Contains 4 GTX transceivers for PCI Express lanes 4-7
- Quad 116:
 - MGTREFCLK0 - Si5324 jitter attenuator
 - MGTREFCLK1 - PCIe edge connector clock
 - Contains 4 GTX transceivers for PCIe lanes 0-3
- Quad 117:
 - MGTREFCLK0 - SGMII clock
 - MGTREFCLK1 - SMA clock
 - Contains 4 GTX transceivers with one allocated for: SMA, SGMII, SFP, and FMC LPC (DP0)
- Quad 118:
 - MGTREFCLK0 - FMC HPC GBT clock 0
 - MGTREFCLK1 - FMC LPC GBT clock 0
 - Contains 4 GTX transceivers for FMC HPC (DP0 - DP3)

[Table 1-10](#) lists the GTX interface connections to the FPGA (U1).

Table 1-10: GTX Interface Connections for FPGA U1

	MGTREFCLK1	FMC HPC GBT_CLK1

For more information on the GTX transceivers see [UG476, 7 Series FPGAs GTX Transceivers User Guide](#).

PCI Express Edge Connector

[Figure 1-2, callout 13]

The 8-lane PCI Express edge connector performs data transfers at the rate of 2.5 GT/s for a Gen1 application and 5.0 GT/s for a Gen2 application. The PCIe transmit and receive signal data paths have a characteristic impedance of $85\Omega \pm 10\%$. The PCIe clock is routed as a 100Ω differential pair. The 7 series FPGAs GTX transceivers are used for multi-gigabit per second serial interfaces.

The XC7K325T-2FFG900C FPGA (-2 speed grade) included with the KC705 board supports up to Gen2 x8.

The PCIe clock is input from the edge connector. It is AC coupled to the FPGA through the MGTREFCLK1 pins of Quad 115. PCIE_CLK_Q0_P is connected to FPGA U1 pin U8, and the _N net is connected to pin U7. The PCIe clock circuit is shown in [Figure 1-15](#).

**Figure 1-15: PCI Express Clock**

PCIe lane width/size is selected via jumper J32 (Figure 1-16). The default lane size selection is 8-lane (J32 pins 5 and 6 jumpered).

**Figure 1-16: PCI Express Lane Size Select Jumper J32**

[Table 1-11](#) lists the PCIe edge connector connections.

	High = Loss of Receiver Signal
	Low = Normal Operation

10/100/1000 Tri-Speed Ethernet PHY

[Figure 1-2, callout 15]

The KC705 board utilizes the Marvell Alaska PHY device (88E1111) U37 for Ethernet communications at 10, 100, or 1000 Mb/s. The board supports MII, GMII, RGMII, and SGMII interfaces from the FPGA to the PHY (Table 1-16). The PHY connection to a user-provided Ethernet cable is through a Halo HFJ11-1G01E RJ-45 connector (P3) with built-in magnetics.

Table 1-16: PHY Default Interface Mode

Mode	Jumper Settings		
	J29	J30	J64
GMII/MII to copper (default)	Jumper over pins 1-2	Jumper over pins 1-2	No jumper
SGMII to copper, no clock	Jumper over pins 2-3	Jumper over pins 2-3	No jumper
RGMII	Jumper over pins 1-2	No jumper	Jumper on

On power-up, or on reset, the PHY is configured to operate in GMII mode with PHY address 0b00111 using the settings shown in [Table 1-17](#). These settings can be overwritten via software commands passed over the MDIO interface.

Table 1-17: Board Connections for PHY Configuration Pins

Pin	Connection on Board	Bit[2] Definition and Value	Bit[1] Definition and Value	Bit[0] Definition and Value
CFG0	V _{CC} 2.5V	PHYADR[2] = 1	PHYADR[1] = 1	PHYADR[0] = 1
CFG1	Ground	ENA_PAUSE = 0	PHYADR[4] = 0	PHYADR[3] = 0

CFG5	V _{CC} 2.5V	DIS_FC = 1	DIS_SLEEP = 1	HWCFG_MD[3] = 1
CFG6	PHY_LED_RX	SEL_BDT = 0	INT_POL = 1	75/50Ω = 0

SGMII GTX Transceiver Clock Generator

[[Figure 1-2, callout 16](#)]

An Integrated Circuit Systems ICS844021I chip (U2) generates a high-quality, low-jitter, 125 MHz LVDS clock from a 25 MHz crystal (X3). This clock is sent to FPGA U1, bank 117 GTX transceiver (clock pins G8 (P) and G7 (N)) driving the SGMII interface. Series AC coupling capacitors are present to allow the clock input of the FPGA to set the common mode voltage. [Figure 1-18](#) shows the Ethernet SGMII clock source.

Figure 1-18: Ethernet 125 MHz SGMII GTX Clock

Table 1-18 shows the connections and pin numbers for the M88E1111 PHY.

Details about the tri-mode Ethernet MAC core are provided in [PG051, LogiCORE IP Tri-Mode Ethernet MAC User Guide](#).

For more information about the Marvell 88E1111 see [\[Ref 4\]](#).

For more information about the ICS 844021-01 see [\[Ref 3\]](#).

USB-to-UART Bridge

[\[Figure 1-2, callout 17\]](#)

The KC705 board contains a Silicon Labs CP2103GM USB-to-UART bridge device (U12) which allows a connection to a host computer with a USB port. The USB cable is supplied in the Evaluation Kit (standard-A plug to host computer, mini-B plug to KC705 board connector J6). The CP2103GM is powered by the USB 5V provided by the host PC when the USB cable is plugged into the USB port on the KC705 board.

Xilinx UART IP is expected to be implemented in the FPGA fabric. The FPGA supports the USB-to-UART bridge using four signal pins: Transmit (TX), Receive (RX), Request to Send (RTS), and Clear to Send (CTS).

Silicon Labs provides royalty-free Virtual COM Port (VCP) drivers for the host computer. These drivers permit the CP2103GM USB-to-UART bridge to appear as a COM port to communications application software (for example, TeraTerm or HyperTerm) that runs on the host computer. The VCP device drivers must be installed on the host PC prior to establishing communications with the KC705 board.

[Table 1-19](#) shows the USB signal definitions at J6.

Table 1-19: USB J6 Mini-B Receptacle Pin Assignments and Signal Definitions

USB Receptacle Pins (J6)	Receptacle Pin Name	Schematic Net Name	Description	U12 Pin (CP2103GM)	U12 Pin Name (CP2103GM)
1	VBUS	USB_VBUS	+5V from host system - U12 CP2103 power	7, 8	REGIN, VBUS
2	D_N	USB_D_N	Bidirectional differential serial data (N-side)	4	D-
3	D_P	USB_D_P	Bidirectional differential serial data (P-side)	3	D+
4	GND	USB_GND	Signal ground	2, 29	GND, GND

Table 1-20 shows the USB connections between the FPGA and the UART.

Table 1-20: FPGA to UART Connections

FPGA U1				Schematic Net Name	CP2013 Device U12		
Pin	Function	Direction	IO Standard		Pin	Function	Direction
L27	RTS	Output	LVCMOS25	USB_CTS	22	CTS	Input

K24	TX	Output	LVCMOS25	USB_RX	24	RXD	Input
M19	RX	Input	LVCMOS25	USB_TX	25	TXD	Output

For more information about the CP2103GM and to download the VCP drivers see [\[Ref 8\]](#).

HDMI Video Output

[Figure 1-2, callout 18]

The KC705 board provides a High-Definition Multimedia Interface (HDMI) video output using the Analog Devices ADV7511KSTZ-P HDMI transmitter (U65). The HDMI output is provided on a Molex 500254-1927 HDMI type-A connector (P6). The ADV7511 is wired to support 1080P 60Hz, YCbCr 4:2:2 encoding via 16-bit input data mapping.

The KC705 board supports the following HDMI device interfaces:

- 18 data lines
- Independent VSYNC, HSYNC
- Single-ended input CLK
- Interrupt Out Pin to FPGA
- I²C
- SPDIF

Figure 1-19 shows the HDMI codec circuit.

UG810_c1_18_011912

Figure 1-19: HDMI Codec Circuit

[Table 1-21](#) lists the connections between the codec and the FPGA.

For more information about the ADV7511KSTZ-P see [\[Ref 1\]](#).

LCD Character Display

[\[Figure 1-2, callout 19\]](#)

A 2-line by 16-character display is provided on the KC705 board ([Figure 1-20](#)).

Figure 1-20: LCD Display

The character display runs at 5.0V and is connected to the FPGA's 1.5V HP bank 33 through a Texas Instruments TXS0108E 8-bit bidirectional voltage level translator (U10). [Figure 1-21](#) shows the LCD interface circuit.

Figure 1-21: LCD Interface Circuit

The KC705 board base board uses a male Samtec MTLW-107-07-G-D-265 2x7 header (J31) with 0.025-inch square posts on 0.100-inch centers for connecting to a Samtec SLW-107-01-L-D female socket on the LCD display panel assembly. The LCD header shown in Figure 1-22.

Figure 1-22: LCD Header Details

[Table 1-23](#) lists the connections between the FPGA and the LCD header.

Table 1-23: FPGA to LCD Header Connections

FPGA Pin (U1)	Schematic Net Name	LCD Header Pin (J31)

For more information about the Displaytech S162D LCD see [\[Ref 2\]](#).

I²C Bus Switch

[\[Figure 1-2, callout 20\]](#)

The KC705 board implements a single I²C port on the FPGA (IIC_SDA_MAIN, IIC_SDA_SCL), which is routed through a TI PCA9548 1-to-8 channel I²C switch (U49). The I²C switch can operate at speeds up to 400 kHz. The U49 bus switch at I²C address 0x74 / 0b01110100 must be addressed and configured to select the desired target back-side device.

The KC705 board I²C bus topology is shown in [Figure 1-23](#).

Figure 1-23: I²C Bus Topology

User applications that communicate with devices on one of the downstream I²C buses must first set up a path to the desired bus through the U49 bus switch at I²C address 0x74 / 0b01110100.

[Table 1-24](#) lists the address for each bus.

Table 1-24: I²C Buses

I ² C Bus	I ² C Switch Position	I ² C Address
USER_CLOCK_SDA/SCL	0	0b1011101
FMC_HPC_IIC_SDA/SCL	1	0bXXXXXX00
FMC_LPC_IIC_SDA/SCL	2	0bXXXXXX00
EEPROM_IIC_SDA/SCL	3	0b1010100
SFP_IIC_SDA/SCL	4	0b1010000
IIC_SDA/SCL_HDMI	5	0b0111001
IIC_SDA/SCL_DDR3	6	0b1010000, 0b0011000
Si5324_SDA/SCL	7	0b1101000

For more information about the PCA9548 see [\[Ref 9\]](#).

Status LEDs

[\[Figure 1-2, callout 21\]](#)

[Table 1-25](#) defines the status LEDs. For user controlled LEDs see [User I/O](#).

Table 1-25: Status LEDs

Reference Designator	Signal Name	Color	Description
DS14	PWRCTL1_VCC4A_PG	GREEN	FMC Power Good
DS20	FPGA_DONE	GREEN	FPGA Configured Successfully

User I/O

[Figure 1-2, callout 22 - 26]

The KC705 board provides the following user and general purpose I/O capabilities:

- Eight user LEDs (callout 22)
 - GPIO_LED_[7-0]: DS27, DS26, DS25, DS3, DS10, DS1, DS4
- Five user pushbuttons and reset switch (callout 23)
 - GPIO_SW_[NESWC]: SW2, SW3, SW4, SW6, SW5
 - CPU_RESET: SW7
- 4-position user DIP Switch (callout 24)
 - GPIO_DIP_SW[3:0]: SW11

- User Rotary Switch (callout 25, hidden beneath the LCD)
 - ROTARY_PUSH, ROTARY_INCA, ROTARY_INCB: SW8
- User SMA (callout 26)
 - USER_SMA_GPIO_P, USER_SMA_GPIO_N: J13, J14
- 2 line x 16 character LCD Character Display (callout 19)
 - If the display is unmounted, connector J31 pins are available as 7 independent 5V GPIOs

User GPIO LEDs

Switches

[Figure 1-2, callout 27 - 28]

The KC705 board Evaluation Board includes a power and a configuration switch:

- Power On/Off Slide Switch SW15 (callout 27)
- FPGA_PROG_B SW14, active-Low (callout 28)

Power On/Off Slide Switch SW15

[Figure 1-2, callout 27]

The KC705 board power switch is SW15. Sliding the switch actuator from the Off to On position applies 12V power from J49, a 6-pin mini-fit connector. Green LED DS22 illuminates when the KC705 board power is on. See [Power Management](#) for details on the onboard power system.

Caution! Do NOT plug a PC ATX power supply 6-pin connector into J49 on the KC705 board. The ATX 6-pin connector has a different pinout than J49. Connecting an ATX 6-pin connector into J49 will damage the KC705 board and void the board warranty.

Figure 1-31 shows the power connector J49, power switch SW15 and indicator LED DS22.

Figure 1-31: Power On/Off Switch SW15

The KC705 Evaluation Kit provides the adapter cable shown in Figure 1-32 for powering the KC705 board from the ATX power supply 4-pin peripheral connector. The Xilinx part number for this cable is 2600304, and is equivalent to Sourcegate Technologies part number AZCBL-WH-1109-RA4.

Figure 1-32: ATX Power Supply Adapter Cable

FPGA_PROG_B Pushbutton SW14 (Active-Low)

[Figure 1-2, callout 28]

Switch SW14 grounds the FPGA's PROG_B pin when pressed. This action initiates an FPGA reconfiguration. The FPGA_PROG_B signal is connected to FPGA U1 pin K10.

See [UG470, 7 Series FPGAs Configuration User Guide](#) for further details on configuring the 7 series FPGAs.

Figure 1-33 shows SW14.

Figure 1-33: FPGA_PROG_B Pushbutton SW14

Configuration Mode and Upper Linear Flash Address Switch (SW13)

[Figure 1-2, callout 29]

FPGA Configuration Mode: DIP switch SW13 positions 3, 4, and 5 control which configuration mode is used at power-up or when the PROG pushbutton is pressed.

Linear BPI Flash Upper Addresses: DIP switch SW13 positions 1 and 2 control the setting of address bits FLASH_A25 and FLASH_A24. The mode signals FPGA_M2, _M1 and _M0 are connected to FPGA U1 pins AB1, AB2 and AB5 respectively. The BPI flash memory U58 address signals FLASH_A24 AND FLASH_A25 are connected to FPGA U1 pins M23 and M22 respectively. Configuration mode is used at power-up or when the PROG pushbutton is pressed.

Figure 1-34 shows the SW13 circuit.

UG810_c1_28_011912

Figure 1-34: Configuration Mode and Upper Linear Flash Address Switch

FPGA Mezzanine Card Interface

[Figure 1-2, callout 30 - 31]

The KC705 board supports the VITA 57.1 FPGA Mezzanine Card (FMC) specification by providing subset implementations of a high pin count (HPC) connector at J22 and a low pin count (LPC) connector at J2. Both connectors use the same 10 x 40 form factor, except the HPC version is fully populated with 400 pins and the LPC version is partially populated with 160 pins. Both connectors are keyed so that the mezzanine card faces away from the KC705 board when connected.

Signaling Speed Ratings:

- Single-ended: 9 GHz (18 Gb/s)
- Differential Optimal Vertical: 9 GHz (18 Gb/s)
- Differential Optimal Horizontal: 16 GHz (32 Gb/s)
- High Density Vertical: 7 GHz (15 Gb/s)

The Samtec connector system is rated for signaling speeds up to 9 GHz (18 Gb/s) based on a -3 dB insertion loss point within a two-level signaling environment.

Connector Type:

- Samtec SEAF Series, 1.27 mm (0.050 in) pitch. Mates with SEAM series connector
- For more information about SEAF series connectors see [\[Ref 6\]](#).

HPC Connector J22

[\[Figure 1-2, callout 30\]](#)

The 400-pin HPC connector defined By the FMC specification ([Figure B-1, page 75](#)) provides connectivity for up to:

- 160 single-ended or 80 differential user-defined signals
- 10 GTX transceivers
- 2 GTX clocks
- 4 differential clocks
- 159 ground and 15 power connections

The connections between the HPC connector at J22 and FPGA U1 ([Table 1-28](#)) implement a subset of this connectivity:

- 58 differential user defined pairs
 - 34 LA pairs (LA00-LA33)
 - 24 HA pairs (HA00-HA23)
- 4 GTX transceivers
- 1 GTX clock
- 2 differential clocks
- 159 ground and 15 power connections

The HPC signals are distributed across GTX Quads 116, 117, and 118. Each of these Quads have their VCCO voltage connected to VADJ.

Note: The KC705 board VADJ voltage for the J22 and J2 connectors is determined by the FMC VADJ power sequencing logic described in the [Power Management, page 63](#).

LPC Connector J2

[Figure 1-2, callout 31]

The 160-pin LPC connector defined by the FMC specification (Figure B-2, page 76) provides connectivity for up to:

- 68 single-ended or 34 differential user-defined signals
- 1 GTX transceiver
- 1 GTX clock
- 2 differential clocks
- 61 ground and 10 power connections

The connections between the LPC connector at J2 and FPGA U1 (Table 1-29) implement a subset of this connectivity:

- 34 differential user defined pairs
 - 34 LA pairs (LA00-LA33)

- 1 GTX transceiver
- 1 GTX clock
- 2 differential clocks
- 61 ground and 9 power connections

Power Management

[Figure 1-2, callout 32]

The KC705 board uses power regulators and PMBus compliant digital PWM system controllers from Texas Instruments to supply core and auxiliary voltages. The Texas Instruments Fusion Digital Power graphical user interface is used to monitor the current and temperature levels of the board's power modules. If any module temperature approaches 85°C then forced air cooling must be provided to keep the module temperature within rated limits.

The PCB layout and power system have been designed to meet the recommended criteria described in [UG483, 7 Series FPGAs PCB Design and Pin Planning Guide](#).

The KC705 board power distribution diagram is shown in [Figure 1-35](#).

UG810_c1_29_042213

Figure 1-35: KC705 Board Onboard Power Regulators

The KC705 board core and auxiliary voltages are listed in [Table 1-30](#).

Table 1-30: Onboard Power System Devices

FMC_VADJ Voltage Control

The FMC_VADJ rail is set to 2.5V. When the KC705 board is powered on, the state of the FMC_VADJ_ON_B signal wired to header J65 is sampled by the Texas Instruments UCD9248 controller U55. If a jumper is installed on J65, signal FMC_VADJ_ON_B is held low, and the TI controller U55 energizes the FMC_VADJ rail at power on.

Because the rail turn on decision is made at power on time based on the presence of the J65 jumper, removing the jumper at J65 after the board is powered up will not affect the 2.5V power delivered to the FMC_VADJ rail and it will remain on.

A jumper installed at J65 is the default setting.

If a jumper is not installed on J65, signal FMC_VADJ_ON_B is high, and the KC705 board will not energize the FMC_VADJ 2.5V at power on. In this mode the user can control when to turn on FMC_VADJ and to what voltage level (1.8V - 3.3V). With FMC_VADJ off the FPGA will still configure and has access to the TI controller PMBUS (on bank 32) along with the FMC_VADJ_ON_B signal (on bank 15 pin J27). The combination of these allows the user to develop code to command the FMC_VADJ rail to be set to something other than the default setting of 2.5V. Once the new FMC_VADJ voltage level has been programmed into TI controller U55, the FMC_VADJ_ON_B signal can be driven low by the user logic and the FMC_VADJ rail will come up at the new FMC_VADJ voltage level. Installing a jumper at J65 after a KC705 board powers up in this mode will turn on the FMC_VADJ rail.

For access to Texas Instruments fusion tools documentation describing PMBUS programming for the UCD9248 digital power controller see [\[Ref 9\]](#).

Cooling Fan Control

Cooling fan RPM is controlled and monitored by user-created IP in the FPGA using the fan control circuit shown in [Figure 1-36](#).

FPGA U1 is cooled by a 12V DC fan connected to J61. 12V_{DC} is provided to the fan through J61 pin 2. The fan GND return is provided through J61 pin 1 and transistor Q17. Fan speed is controlled by a pulse-width-modulated signal from FPGA U1 pin L26 (on bank 15) driving the gate of Q17. The default unprogrammed FPGA fan operation mode is ON. The fan speed tachometer signal on J61 pin 3 can be monitored on FPGA U1 pin U22 (on bank 14).

Figure 1-36: FPGA Cooling Fan Circuit

Monitoring Voltage and Current

Voltage and current monitoring and control are available for selected power rails through the Texas Instruments Fusion Digital Power graphical user interface. The three onboard TI power controllers (U55 at address 52, U56 at address 53, and U89 at address 54) are wired to the same PMBus. The PMBus connector, J39, is provided for use with the TI USB Interface Adapter PMBus pod (TI part number EVM USB-TO-GPIO), which can be ordered from the TI website [Ref 10], and the associated TI Fusion Digital Power Designer GUI (downloadable from [Ref 11]). This is the simplest and most convenient way to monitor the voltage and current values for the power rail listed in [Table 1-31](#), [Table 1-32](#) and [Table 1-33](#).

In each of these the three tables (one per controller), the Power Good (PG) On Threshold is the set-point at or below which the particular rail is deemed “good”. The PG Off Threshold is the set-point at or below which the particular rail is no longer deemed “good”. The controller internally OR’s these PG conditions together and drives an output PG pin high only if all active rail PG states are “good”. The On and Off Delay and rise and fall times are relative to when the board power on-off slide switch SW15 is turned on and off.

[Table 1-31](#) defines the voltage and current values for each power rail controlled by the UCD9248 PMBus controller at Address 52 (U55).

Table 1-31: Power Rail Specifications for UCD9248 PMBus controller at Address 52

Rail Number	Rail Name	Schematic Rail Name	Nominal V _{out} (V)	PG On Threshold (V)	PG Off Threshold (V)	On Delay (ms)	Rise Time (ms)	Off Delay (ms)	Fall Time (ms)	Shutdown Threshold ⁽¹⁾		
										V _{out} Over Fault (V)	I _{out} Over Fault (A)	Temp Over Fault (°C)

XADC Header

[Figure 1-2, callout 33]

7 Series FPGAs provide an Analog Front End (XADC) block. The XADC block includes a dual 12-bit, 1 MSPS Analog-to-Digital Convertor (ADC) and on-chip sensors.

See [UG480, 7 Series FPGAs XADC Dual 12-Bit 1MSPS Analog-to-Digital Converter User Guide](#) for details on the capabilities of the analog front end. Figure 1-37 shows the KC705 board XADC support features.

Figure 1-37: Header XADC_VREF Voltage Source Options

The KC705 board supports both the internal FPGA sensor measurements and the external measurement capabilities of the XADC. Internal measurements of the die temperature, VCCINT, VCCAUX, and VCCBRAM are available. The KC705 board VCCINT and VCCBRAM are provided by a common 1.0 V supply.

Jumper J47 can be used to select either an external differential voltage reference (XADC_VREF) or on-chip voltage reference (jumper J47 2–3) for the analog-to-digital converter.

For external measurements an XADC header (J46) is provided. This header can be used to provide analog inputs to the FPGA's dedicated VP/VN channel, and to the VAUXP[0]/VAUXN[0], VAUXP[8]/VAUXN[8] auxiliary analog input channels. Simultaneous sampling of Channel 0 and Channel 8 is supported.

A user-provided analog signal multiplexer card can be used to sample additional external analog inputs using the 4 GPIO pins available on the XADC header as multiplexer address lines. [Figure 1-38](#) shows the XADC header connections.

Figure 1-38: XADC header (J46)

Table 1-34 describes the XADC header J46 pin functions.

Table 1-34: XADC Header J46 Pinout

Net Name	J46 Pin Number	Description
VN, VP	1, 2	Dedicated analog input channel for the XADC.
XADC_VAUX0P, N	3, 6	Auxiliary analog input channel 0. Also supports use as IO inputs when anti alias capacitor is not present.
XADC_VAUX8N, P	7, 8	Auxiliary analog input channel 8. Also supports use as IO inputs when anti alias capacitor is not present.
DXP, DXN	9, 12	Access to thermal diode.
XADC_AGNDA	4, 5, 10	Analog ground reference.
XADC_VREF	11	1.25V reference from the board.
XADC_VCC5V0	13	Filtered 5V supply from board.
XADC_VCC_HEADER	14	Analog 1.8V supply for XADC.
VADJ	15	VCCO supply for bank which is the source of DIO pins.
GND	16	Digital Ground (board) Reference
XADC_GPIO_3, 2, 1, 0	19, 20, 17, 18	Digital IO. These pins should come from the same bank. These IOs should not be shared with other functions because they are required to support three-state operation.

Configuration Options

The FPGA on the KC705 board can be configured by the following methods:

- Master BPI (uses the Linear BPI Flash).
- Master SPI (uses the Quad-SPI Flash).
- JTAG (uses the USB-to-JTAG Bridge or Download cable). See [USB JTAG Module, page 24](#) for more information

See [UG470, 7 Series FPGAs Configuration User Guide](#) for details on configuration modes.

The method used to configure the FPGA is controlled by the mode pin (M2, M1, M0) settings selected through DIP switch SW13. [Table 1-35](#) lists the supported mode switch settings.

Table 1-35: Mode Switch SW13 Settings

Configuration Mode	Mode Pins (M[2:0])	Bus Width	CCLK Direction
Master SPI	001	x1, x2, x4	Output
Master BPI	010	x8, x16	Output
JTAG	101	x1	Not Applicable

[Figure 1-39](#) shows mode switch SW13.

UG810_c1_32_120511

Figure 1-39: Mode Switch

The mode pins settings on SW13 determine if the Linear BPI Flash or the Quad SPI Flash is used for configuring the FPGA. DIP switch SW13 also provides the upper two address bits for the Linear BPI Flash and can be used to select one of multiple stored configuration bitstreams. [Figure 1-40](#) shows the connectivity between the onboard non-volatile Flash devices used for configuration and the FPGA.

To obtain the fastest configuration speed an external 66 MHz oscillator is wired to the EMCCLK pin of the FPGA. This allows users to create bitstreams that will configure the

FPGA over the 16-bit data path from the Linear BPI Flash memory at a maximum synchronous read rate of 33 MHz. The bitstream stored in the Flash memory must be generated with a bitgen option to divide the EMCCLK by two.

Figure B-2: FMC LPC Connector Pinout

Master Board Constraints

The KC705 board Xilinx® design constraints (XDC) file template provides for designs targeting the KC705 board. Net names in the constraints listed below correlate with net names on the latest KC705 board schematic. Users must identify the appropriate pins and replace the net names below with net names in the user RTL. See UG625, *Constraints Guide* for more information.

Users can refer to the XDC files generated by tools such as Memory Interface Generator (MIG) for memory interfaces and Base System Builder (BSB) for more detailed I/O standards information required for each particular interface. The FMC connectors J2 and J22 are connected to 2.5V V_{CCO} banks. Because each user's FMC card implements customer-specific circuitry, the FMC bank I/O standards must be uniquely defined by each customer.

Note: The constraints file listed in this appendix might not be the latest version. Always refer to the Kintex-7 KC705 Evaluation Kit product page (www.xilinx.com/kc705), **Doc & Designs** tab, for the latest versions of the FPGA pins constraints files (UCF and XDC files). Choose the Xilinx tools link and then in the search box, search for "KC705 Master UCF and XDC File".

KC705 Board XDC Listing

Board Setup

Installing KC705 Board in a PC Chassis

Installation of the KC705 board inside a computer chassis is required when developing or testing PCI Express functionality.

When the KC705 board is used inside a computer chassis (i.e., plugged in to the PCIe® slot), power is provided from the ATX power supply 4-pin peripheral connector through the ATX adapter cable shown in [Figure D-1](#) to J18 on the KC705 board. The Xilinx part number for this cable is 2600304.

Figure D-1: ATX Power Supply Adapter Cable

To install the KC705 board in a PC chassis:

1. On the KC705 board, remove the six screws retaining the six rubber feet with their standoffs, and the PCIe bracket. Reinstall the PCIe bracket using two of the previously removed screws.
 2. Power down the host computer and remove the power cord from the PC.
 3. Open the PC chassis following the instructions provided with the PC.
 4. Select a vacant PCIe expansion slot and remove the expansion cover (at the back of the chassis) by removing the screws on the top and bottom of the cover.
 5. Plug the KC705 board into the PCIe connector at this slot.
 6. Install the top mounting bracket screw into the PC expansion cover retainer bracket to secure the KC705 board in its slot.
- Note:** The KC705 board is taller than standard PCIe cards. Ensure that the height of the card is free of obstructions.
7. Connect the ATX power supply to the KC705 board using the ATX power supply adapter cable as shown in [Figure D-1](#):
 - a. Plug the 6-pin 2 x 3 Molex connector on the adapter cable into J49 on the KC705 board.
 - b. Plug the 4-pin 1 x 4 peripheral power connector from the ATX power supply into the 4-pin adapter cable connector.

8. Slide the KC705 board power switch SW12 to the ON position. The PC can now be powered on.

Board Specifications

Dimensions

Height 5.5 in (14.0 cm)

Length 10.5 in (26.7 cm)

Note: The KC705 board height exceeds the standard 4.376 in (11.15 cm) height of a PCI Express card.

Environmental

Temperature

Operating: 0°C to +45°C

Storage: -25°C to +60°C

Humidity

10% to 90% non-condensing

Operating Voltage

+12 V_{DC}

Regulatory and Compliance Information

This product is designed and tested to conform to the European Union directives and standards described in this section.

Refer to the master answer record concerning the CE requirements for the PC Test Environment available at:

www.xilinx.com/support/answers/45934.htm

Declaration of Conformity

To view the Declaration of Conformity online, please visit:

[http://www.xilinx.com/support/documentation/boards_and_kits/
ce-declarations-of-conformity-xtp251.zip](http://www.xilinx.com/support/documentation/boards_and_kits/ce-declarations-of-conformity-xtp251.zip)

Directives

2006/95/EC, *Low Voltage Directive (LVD)*

2004/108/EC, *Electromagnetic Compatibility (EMC) Directive*

Standards

EN standards are maintained by the European Committee for Electrotechnical Standardization (CENELEC). IEC standards are maintained by the International Electrotechnical Commission (IEC).

Electromagnetic Compatibility

EN 55022:2010, *Information Technology Equipment Radio Disturbance Characteristics – Limits and Methods of Measurement*

EN 55024:2010, *Information Technology Equipment Immunity Characteristics – Limits and Methods of Measurement*

This is a Class A product and can cause radio interference. In a domestic environment, the user might be required to take adequate corrective measures.

Safety

IEC 60950-1:2005, *Information technology equipment – Safety, Part 1: General requirements*

EN 60950-1:2006, *Information technology equipment – Safety, Part 1: General requirements*

Markings

This product complies with Directive 2002/96/EC on waste electrical and electronic equipment (WEEE). The affixed product label indicates that the user must not discard this electrical or electronic product in domestic household waste.

This product complies with Directive 2002/95/EC on the restriction of hazardous substances (RoHS) in electrical and electronic equipment.

This product complies with CE Directives 2006/95/EC, *Low Voltage Directive (LVD)* and 2004/108/EC, *Electromagnetic Compatibility (EMC) Directive*.
